When it comes to Encapsulated Time-Delay Relays, Grainger's got your back. Effortless ordering and convenient delivery. Log-in or register for your pricing.

Encapsulated Time-Delay Relays - Relays and Accessories ...

Upon application of input voltage, the time delay relay is ready to accept a trigger. When the trigger is applied, the time delay (t1) begins and the output is energized for the time delay (t2). At the end of this time delay (t2), the output is de-energized and remains in that condition for the time delay (t2).

Solid-state Fixed Timing Relays. Bulletin 700-RTC Solid-state Timing Relays are fixed timing relays designed for applications requiring a specific time delay in which inadvertent timing changes must be avoided. They offer the reliability of a fixed solid-state design with comparable contact isolation to an electromechanical relay.

Power outputs provide over current fault shut-down protection. Wiring connections are standard automotive ¼" push-on terminals, and these solid state relays connect to standard relay connectors. Solid-state relays (SSR's) lack of moving components increases its long-term reliability compared to similar electromechanical relays.

Solid State Relays and Timer Relays | Waytek Wire

A Solid State Relay is an electronic device in which a small input signal controls a larger output signal. Time Delay Relays and Solid State Timers provide time-delayed switching, resulting in a simple and reliable control for industrial applications.

Replacing a Mechanical Time Delay Relay with a Solid State ...

Time Delay Relay. Time delay relays and solid-state timers similar and are used to provide the desired delay and timing functions. Timers are constructed with dials, displays, or some type of operator interface used to set the time and contact state to normally open or normally closed on the device.

Some TDRs have solid-state outputs instead of relay outputs. Traditionally, TDRs were available only as single-function, single-time-range devices. These devices are still available and are typically used in applications where the timing needs to be locked in.

Solution/Resolution: When the trigger is applied, the time delay (t_1) begins. At the end of the time delay (t_1), the output is energized and remains in that condition for the time delay (t_2). At the end of the time delay (t_2), the output is de-energized & the relay is ready to accept another trigger.
